AST Microwave offers three types of Quick Disconnects (QDCs), for a variety of applications. We offer 2 different one-piece versions, and 1 three-piece version. Depending on the strength required and the environment of each type of application, a specific type can be recommended. In situations where two mating devices are subject to extreme environmental conditions, the three piece version with optional protective caps would be recommended. In situations where the ingress of foreign particles into the components is not a factor, but depending on the strength required, one of the other two types would be recommended.

Features:

- WR-28 to WR-137
- Anodized Aluminum and/or Passivated Steel Construction
- Standard flange configurations
- Customized flange versions available
- Protective cap option
